Tsuga heterophylla - Pseudotsuga menziesii - Thuja plicata / Achlys triphylla - Gymnocarpium dryopteris

Western Hemlock - Douglas-fir - Western Red Cedar / Vanilla-leaf - Common Oak Fern

Pruche de l'Ouest - Douglas de Menzies - Thuya géant / Achlyde à trois folioles - Gymnocarpe du chêne

Subassociations: none

CNVC Alliance: not yet determined

CNVC Group: not yet determined

Type Description

Concept: CNVC00006 is an endemic moist maritime coniferous association that occurs up to approximately 700 mASL along the eastern slopes of the Vancouver Island Ranges of British Columbia and also on adjacent islands of the Discovery Islands Group. Slope positions vary from middle to lower, with gradients that are normally gentle. Well- to moderately well-drained, mesic to moist, comparatively rich, medium-textured soils are typical for this association. In this mature to old-forest stage, Douglas-fir (*Pseudotsuga menziesii*), western hemlock (*Tsuga heterophylla*), and western red cedar (*Thuja plicata*) characteristically dominate the canopy. The shrub layer is dominated by western hemlock regeneration, with moderate abundance of red huckleberry (*Vaccinium parvifolium*). There are a number of rich-site indicators, such as vanilla-leaf (*Achlys triphylla*), common oak fern (*Gymnocarpium dryopteris*), three-leaved foamflower (*Tiarella trifoliata*), and western sword fern (*Polystichum munitum*) in the herb layer. Oregon beaked moss (*Eurhynchium oreganum*) and lanky moss (*Rhytidadelphus loreus*) are the main mosses.

Vegetation: *Pseudotsuga menziesii*, *Tsuga heterophylla*, and *Thuja plicata* characteristically dominate the canopy of these mature to old-forest communities. *Abies amabilis* is occasionally present but is more characteristic of higher elevation climates in this area. Dry summer weather contributes to a history of extensive wildfires, which, along with excellent height growth on these sites, often results in the presence of very large *Pseudotsuga menziesii* reaching well above other conifer species in the canopy. The shrub layer is dominated by *Tsuga heterophylla* regeneration, with moderate abundance of *Vaccinium parvifolium*, *V. alaskaense* and *Mahonia nervosa*. A number of rich-site indicators, such as *Achlys triphylla*, *Gymnocarpium dryopteris*, *Tiarella trifoliata* (see the Comments section) and *Polystichum munitum* are prominent in the herb layer. *Eurhynchium oreganum*, *Rhytidadelphus loreus* and *Hylocomium splendens* are the main species in the poorly developed moss layer, often with *Plagiomnium insigne* or *Rhytidopsis robusta*.

Environment: CNVC00006 may be found in moist maritime climates up to roughly 700 mASL. Due to elevation and geography, cool, summer-dry conditions prevail. Slope positions vary from middle to lower, with mainly gentle gradients. Well- to moderately well-drained, mesic to moist, comparatively rich, medium-textured soils are normal for these sites. Forest floor materials are mostly friable, indicating relatively good decomposition rates and nutrient cycling.

Canadian National Vegetation Classification (CNVC) Classification nationale de la végétation du Canada (CNVC)

***Tsuga heterophylla - Pseudotsuga menziesii - Thuja plicata / Achlys triphylla - Gymnocarpium dryopteris* CNVC00006**

Type Description (cont'd)

Dynamics: As a result of intensive logging on the leeward slopes of the Vancouver Island Ranges in the past century, very few of the once extensive old-forest successional stages remain. Under natural conditions, where stands are sheltered from direct wind exposure and fires are infrequent, stand replacement is gradual through the mortality and replacement of individual or small numbers of canopy trees. Stand-replacing fires, although uncommon, can occur. If not too intense, fire can favour *Pseudotsuga menziesii*, as this species can survive low intensity fire better than the other tree species in this association. These tall forests often have considerable variability in vertical structure and age composition. Balsam woolly adelgid (*Adelges piceae*) poses a medium to high threat for *Abies amabilis*.

Range: This Canadian endemic association occurs at montane elevations along the eastern (leeward) side of the Vancouver Island Ranges of British Columbia, from near Jordan River in the south to Sayward in the north, and also including the islands from Quadra to West Thurlow.

Conservation Status (NatureServe)

Relationships with Other Classifications:

Comments

On rich sites in this climate, the wetter CNVC00028 [*Tsuga heterophylla - Abies amabilis / Oplopanax horridus / Gymnocarpium dryopteris*] has abundant *Oplopanax horridus*; if *Oplopanax horridus* is present in communities of CNVC00006, it is with low cover. The dryer, rich-site CNVC00034 [*Tsuga heterophylla - Abies amabilis - Pseudotsuga menziesii / Achlys triphylla / Rhytidopsis robusta*] lacks *Gymnocarpium dryopteris* and has lower cover of the other rich-site indicators.

Tiarella trifoliata (three-leaved foamflower) may include *T. trifoliata* var. *laciniata* (cut-leaved foamflower), *T. trifoliata* var. *trifoliata* (three-leaved foamflower) and/or *T. trifoliata* var. *unifoliata* (one-leaved foamflower).
